

The Perfect Patient Pathway (PPP) Test Bed aims to benefit people with multiple long term conditions through combining and integrating innovative technologies and pioneering service designs to keep patients well and independent and avoid unnecessary hospital attendances. The Test Bed involves 28 partners spanning across healthcare; social care; academia; care homes; technology and voluntary sector organisations.

The CareTRx Programme aims to understand how an innovative combination of digital technology, behavioural change science and patient support services can be of benefit to patients in the self-management of their asthma condition.

The Digital Care Home project is enabling care home staff to use existing equipment to record routine monitoring information for residents electronically and communicate with community nursing teams or local GPs to identify the best course of action if there are early signs of patient deterioration.

The Emergency Contact project is designed to provide carers and patients with an easy way to keep an up-to-date medical record on their smartphone to improve care coordination in transitions of care between GP practices, urgent care centres, A&Es and inpatient units. The user can display health information locally on their smartphone during any medical encounter or, if they are unable to do so, healthcare professionals and first responders can scan a QR code generated by the app to view a record which has had personal identifiers removed.

The Strength & Balance (Falls Prevention) project is inviting people aged over 65 who are identified as moderately frail on the Electronic Frailty Index (EFI) and have not yet had a recorded fall on the primary care system to have their falls risk assessed by a trained Health Care Assistant using the QTUG™ device in primary, secondary and community care settings. Those identified as having a score of over 50% (high risk) will be referred onto the Falls Pathway for a home assessment and intervention.

The Digital Health Training project involves co-designed resources and training for health professionals to become 'Digital Health Champions'; the new, specialised role of Digital Health Champion would be to enable new conversations, between people delivering care and people with long-term conditions, to encourage and support the use of digital health for self-management alongside clinical interventions.
